PBX:

A private branch exchange (PBX) is the foundation of communications in business, enabling employees to communicate productively amongst themselves as well as outside the enterprise. We have sold Thousands of Panasonic PBX all over Pakistan. We can help setup a small 3x8 exchange (3 PTCL lines, 8 intercom extensions) as well as biggest Panasonic models with up to 500 extensions. We currently deal in following Panasonic series: TES, TEM, TDA, NS etc.

The Values Added Services (VAS) we provide are:

- Multi Branch Setup
- VoIP gateways to allow internet connectivity of PBX at multiple sites
- Call Centers functionality using PBX and Analog phones
- Computer Telephony Integration (CTI)
- Voice Mail Systems
- Call Logging
- Call Recording
- Incoming Greeting
- Automatic Call Distribution (ACD)
- Analog and Digital Telephone sets, as well as operator consoles.

DIGITAL PABX:

Digital technology breaks your voice signal into binary code—a series of 1s and 0s—transfers it to the other end where another device (phone, modem, etc.) takes all the numbers and reassembles them into the original voice. This prevents voice from picking noise along the way. Hence there is marked improvement in clarity of voice. Further the digital system permits greater flow of data between telephone sets. Thus we see a wide variety of telephones with bigger displays and multiple keys.

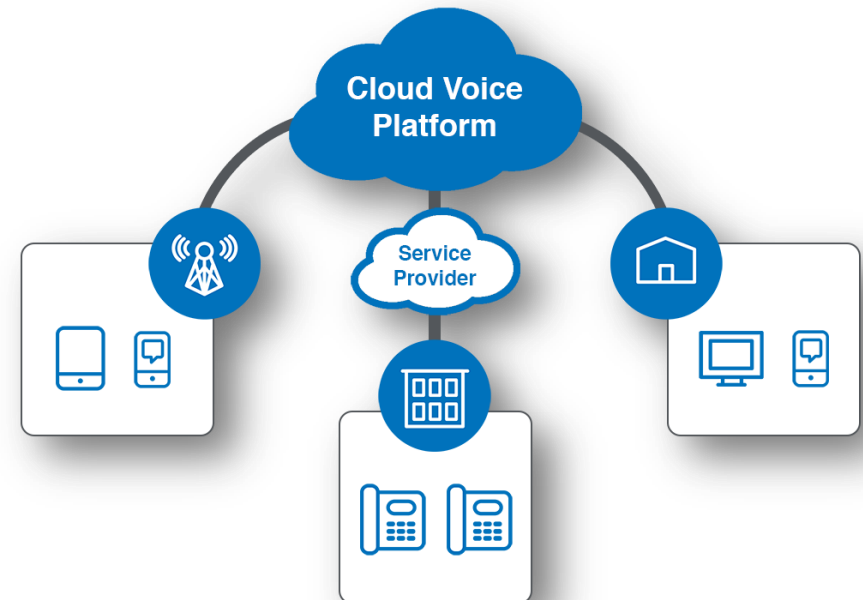

The development of latest Voice over Internet Phone (VoIP) is an example of digital technology helping companies to reduce cost and allow greater ease...

The most effective use of the digital versus analog technology is in the booming cellular market. With new phone activations increasing exponentially, the limits of analog are quickly being realized. Digital cellular lets significantly more people use their phones within a single coverage area. More data can be sent and received simultaneously by each phone user. Plus, transmissions are more resistant to static and signal fading. And with the all-in-one phones out now—phone, pager, voice mail, internet access—digital phones offer more features than their analog predecessors.

HYBRID PABX:

The latest and most widely used systems, Hybrid PBXs can use single line telephones (SLT) in addition to an electronic proprietary telephone or Electronic Key Telephones. It is this feature that makes them popular because users have a choice whether to go for the expensive but feature-rich telephone sets or inexpensive standard telephones. A digital hybrid PBX will have all the advanced features found on a digital system while an analog version will miss out many of the digital functions. The latest models even have an option of adding a complete Multi-Cell Wireless phone system, while the Hybrid IP-PBX makes it possible to connect multiple branches and off-site staff (remote workers, home workers) to a single Hybrid IP-PBX in your main office with the ease of IP.

Panasonic

Inovatek offers your business or home on-site or off-site monitoring with advance features such as PC based Recording.

Viewing, digital recording and archiving, sensor based recording, etc. Our solutions do not require any 3rd-party integration as we will package together a server with required hardware & software*, along with taking care of networking, cabling, installation, and training.

Our solutions are being used in various single-site and multi-site configurations by small businesses such as dairy shops, to manufacturers with several factories and retail outlets, and finally by financial institutions requiring critical monitoring of their ATMs & locker rooms.

All our security products come with 1 year free service and 1 year guarantee – parts, labour and everything in between, including installation and training.

Please call us now for a free consultation about your security needs.

Simple Solutions for Complex Connections:

Integrated, networked systems are at the very heart of e-commerce. In a perfect world, companies would be able to network all of their underlying computer systems, both new and old, together in a seamless fashion. Employees, customers, and business partners would have instant, real-time access to the information contained in these systems and would be able to access and share it easily. Unfortunately, many legacy systems were not designed to be used with other systems, or to be accessed via the Internet. One of the biggest challenges facing businesses and entire industries is connecting applications and networks together at the company and industry level and getting them to work reliably.

SITE DEVELOPMENT

True to our promise of being a true business solution provider for the Pakistan's corporate market, we provide Professional wiring services that usually fall under the domain of contractors (thaykaydaar).

Whether you are making modifications to your existing physical infrastructure, or building a new facility, Inovatek can provide you with complete peace of mind when it comes to Networking, Voice or data cabling. A healthy and well laid out infrastructure is a must for your investment in Electrical and IT investments to work free of defect for long periods of time. You have invested heavily in best of the breed communication and Personal Computing hardware – why risk its peak performance by using sub-standard cabling installed by poorly qualified miseries.

Our experience

Inovatek has experience of performing data and voice cabling for offices and buildings. Inovatek not only provide the data and voice cabling/wiring services it's also provide the hardware equipment's related with Voice (Telephone Exchange/PABX) and Data (Networking) material as well.

- Password protection, Walk Through Gate Price Lahore.

Digital Services:

A Digital Service is one that has been entirely automated and which is controlled by the Customer of the Service, for example, as an "app" on a mobile phone or tablet PC. Furthermore, a Digital Service is usually an on-line service or it contains a significant on-line component. For example, a Digital Service may use information from a separate computer system or another Digital Service accessed in real time through the internet or an alternative network. Two or more Digital Services can be combined to produce a single, more powerful Digital Service for a Customer.
